

USING QUICKWAVE SOFTWARE

QuickWave is a simplified version of WaveReader designed to be used only for the viewing of video clips saved to a disk from a GE / Kalatel DVR. See the document on our Support page on how to do this.

- Click on “File” then “Open” to choose the location of the saved video file. QuickWave files have an extension of either .20D or .60D, and you may have to choose this at the bottom.

- Select the file by double-clicking on the file or by clicking the “Open” button. QuickWave can now be used similar to WaveReader, having all normal playback functions of the full program. Use the Play “▶” button to start the video playback. You can use the sliders to control playback speed and position, and make camera selections as normal.
