KEYSCAN ACCESS CONTROL SYSTEMS

IMAGINE ACCESS CONTROL FROM ANYWHERE, WITH POINT AND CLICK SIMPLICITY.

You'll wish all your company systems were this flexible, this reliable, this easy.

Picture a system that not only controls door, elevator, garage and parking lot access but even monitors building maintenance systems, for any number of locations. Now imagine the convenience of programming the entire system anywhere you choose. Regulate who goes where and when. With point and click simplicity, the easy to use Keyscan software guides you every step of the way. Need more? Picture a system that acts as a security management tool offering customized history transaction reports and a comprehensive database, all at your fingertips. Select from a wide range of access control hardware and software features to suit your budget. Top it all off with proven performance and reliability. That's the Keyscan Access Control System, sold around the world. So don't imagine any longer, because our systems are available today — flexible, easy, affordable. We're sure you'll be impressed.

Protect Remote Sites

From any location, whether it's connected by a modem or on a LAN/WAN, you can manage the entire access control system for a single site or multiple sites. Use the database to search, sort, and view cardholder information to decide who is granted or denied access to any area of a building. Make effective decisions for each location using the Keyscan software's access control management features.

Door Control

Employers know that to get the job done and succeed in today's highly competitive and demanding world, the traditional 9 to 5 schedule no longer applies. Many employers operate with multiple shifts to meet production quotas or individuals in various departments must periodically work late to complete their projects on time—day or night, weekdays or weekends. In short, people are coming and going at all hours. And, because people are coming and going at all hours, a Keyscan access control system ensures that you not only control access to all areas in your buildings, but lets you know who has been where and at what time.

You control access by permitting or denying entry to every door within the system. And you can set the times that individuals may do so. Allow office employees to enter via the lobby door after 8:00 a.m.; allow factory employees to enter via a side door after 7:00 a.m., and then only if a supervisor has arrived. Delayed by bad weather? Keyscan's 'First Person In' feature ensures that doors remain locked until an authorized level of management has arrived to unlock the door.

You assign individuals to groups based on their access needs and security levels. For example, you might assign new employees to a group with access limited to weekdays between 9:00 a.m. and 6:00 p.m., while you assign senior employees to a different group with more extensive access hours including weekends. Further, you stipulate who goes where. Some personnel may not require access to sensitive R&D facilities or to confidential software engineering areas. You have the flexibility to program all these conditions to enforce security. As well, the Keyscan software records all door activity giving you a complete audit trail, which can be quickly compiled into easy-to-read reports.

With a Keyscan Access Control System, your staff has the autonomy to move within the necessary areas of the building to perform their jobs, while you retain a secure environment.

Elevator Control

As well as door control, the Keyscan system provides the same control for elevators, whether it's a high rise commercial, institutional, or residential building. Property managers can define which tenants can access which floors, while tenants can stipulate which staff members can access specific floors at specific times. Connected to elevator control units, readers are installed in proximity to each elevator. Employees or residents, each assigned a card, pass it over the reader at the elevator. The Keyscan system records the scan and only allows authorized individuals access to assigned floors at assigned times.

ID Badges

The Keyscan cardholder database allows you to define what information you need to keep for each person: parking space, employee number, date of hire, etc. For health clubs, you can track membership renewal dates, or types of membership. You can quickly and easily generate reports or conduct investigations using these optional, programmable fields. Create high security and professional looking I.D. badges, showing the photograph, name, title, department, etc. Color code badges to designate departments or job functions, or print barcode employee numbers on the cards for use in other systems, like time and attendance.

User Verification

With Keyscan's Keybadge software option, you can verify that the actual cardholder is carding in, and not an imposter. As each person enters, their picture appears on the computer screen, together with their name, door descriptor, and date and time. This effectively stops theft or loaning of cards.

CCTV Integration

Integrate and control your CCTV system through the Keyscan software. You can preset pan, tilt, and zoom commands, or program the system to record video from specific cameras on specified alarm signals.

E-mail or Page Alarms

Define alarm points, e.g. doors forced open, or doors propped open beyond the allotted time. The Keyscan software will automatically send that alarm information to the designated email address or pager. Now security personnel or property managers can maintain control of the building from anywhere, any time via their handheld wireless devices.

Single or Multiple Buildings

Any number of buildings can be controlled from single or multiple locations. The Corporate Security Director can override control of any of the Corporation's facilities, worldwide. Meanwhile local managers can administer cardholder databases for their own operations.

Scalable

Keyscan systems are scalable up to vary large worldwide organizations, with many buildings, hundreds of doors, and thousands of people – while retaining the simplicity and ease of use that have become synonymous with Keyscan.

ANY ACCESS CONTROL SYSTEM CAN PERMIT OR DENY ACCESS.

But Keyscan gives you total timing control over all entry, monitor points & elevators. With this impressively flexible system, you can program individual control points to deny access to certain cardholders only at certain times of the day or holidays. You can group a set of alarm control points, and program a time schedule for the entire zone so your production department, for example, can come and go during a shift change, while the executives or accounting alarm control points are kept secure. Keyscan gives you complete global control of all points, so you can program ensure your employees and facilities security.

SECURITY EXPERTISE TRUSTED BY SOME OF THE WORLD'S TOP COMPANIES

After carefully examining the security field, many of North America's top companies and multi-national organizations have chosen Keyscan products and systems to keep their residential, commercial and industrial premises secure and running smoothly.

With some of the world's most advanced technology and sophisticated software design, you can always count on Keyscan's ongoing research and development to bring you leading edge access control and security systems.

And as hardware and software is enhanced, you can always depend on new developments being compatible with the system you have today.

You see, we've grown as a company by making sure your system can grow with you.
